Creation Of Web Server using user_data.sh file.

What a User Data File Actually Is

A **user data file** is a **startup script** that runs **automatically the first time a cloud VM boots**.

When you launch a VM (like an EC2 instance), the cloud platform injects this script and the OS runs it as **root** during boot.

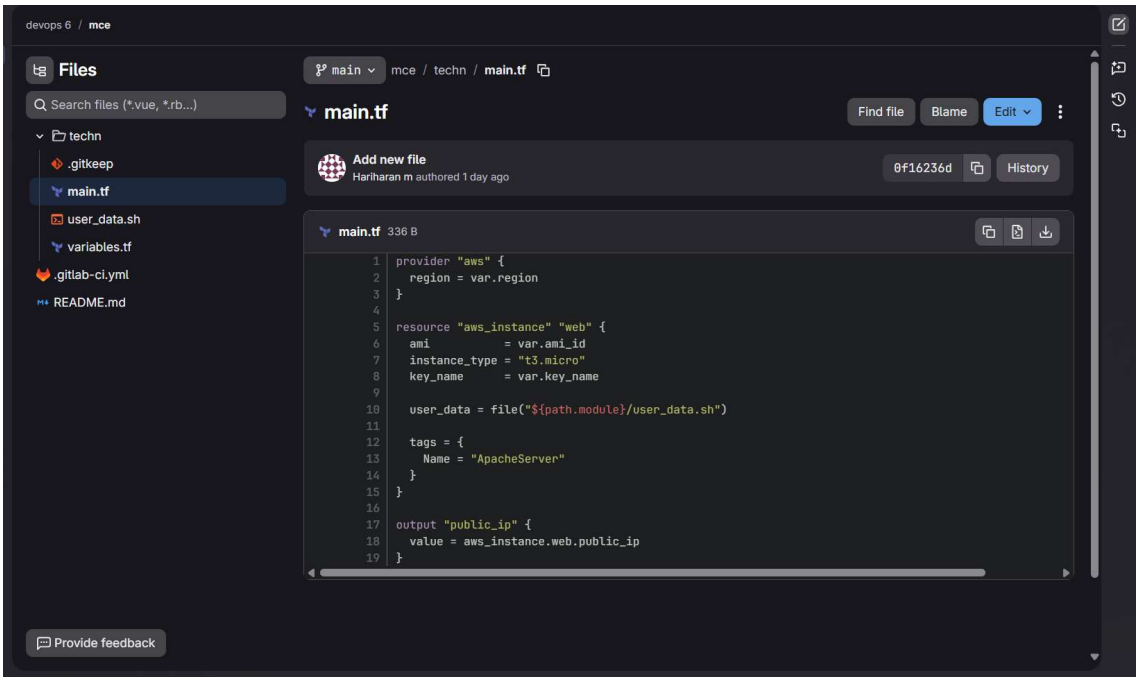
In Simple Terms

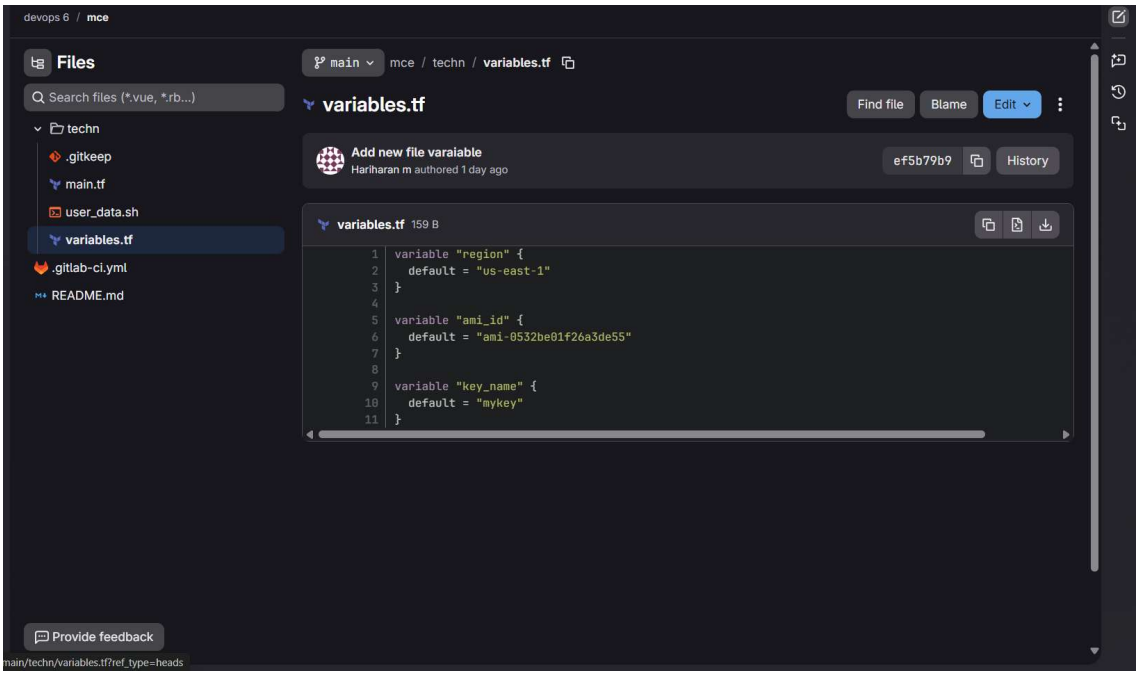
User data = "Do this stuff the moment the server is born."

Typical uses:

- Install packages
- Configure services
- Deploy applications
- Download files from the web
- Start servers automatically

Using the **user_data.sh** shell scripting file I have created an instance and run the web server





When the stages have been cleared I have checked the instance state.

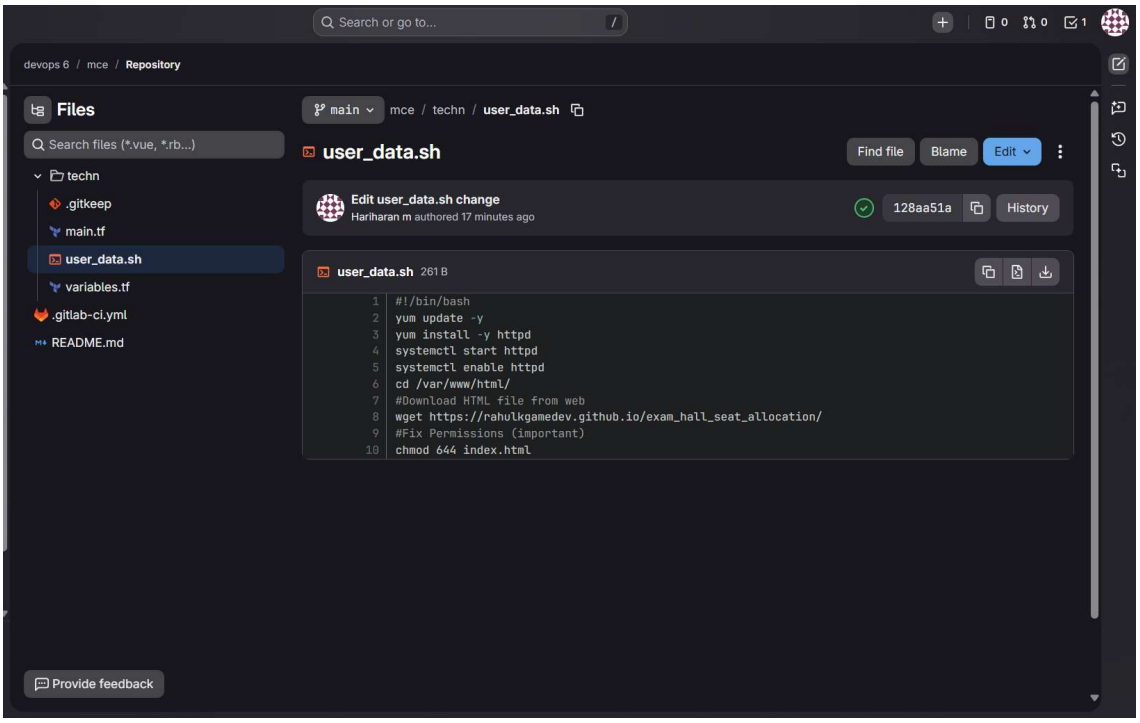
Then this web server have been hosted in the web.

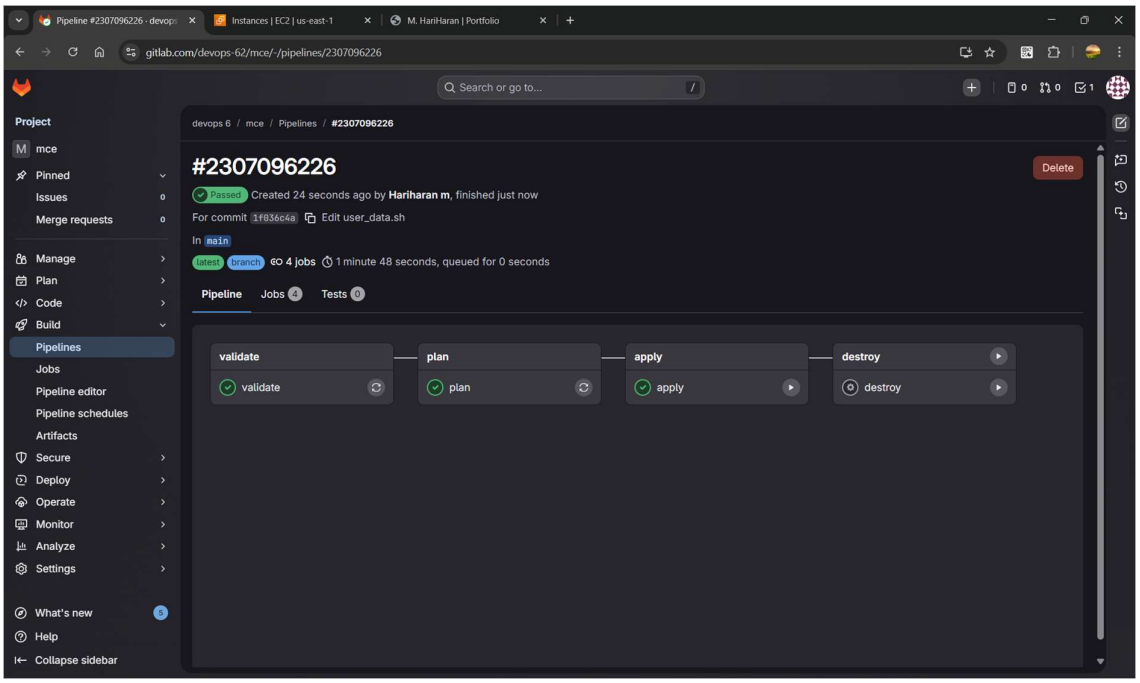
Deployed using GitLab CI + Terraform

Customized Web Hosting using user_data.sh file.

I have used this command to host my website using **used_data.sh** file.



The stages have been cleared and the hosting is in process



This is the hosted website using the **user_data.sh** file.
