Gitlab Webserver Automate Using Dockerfile.

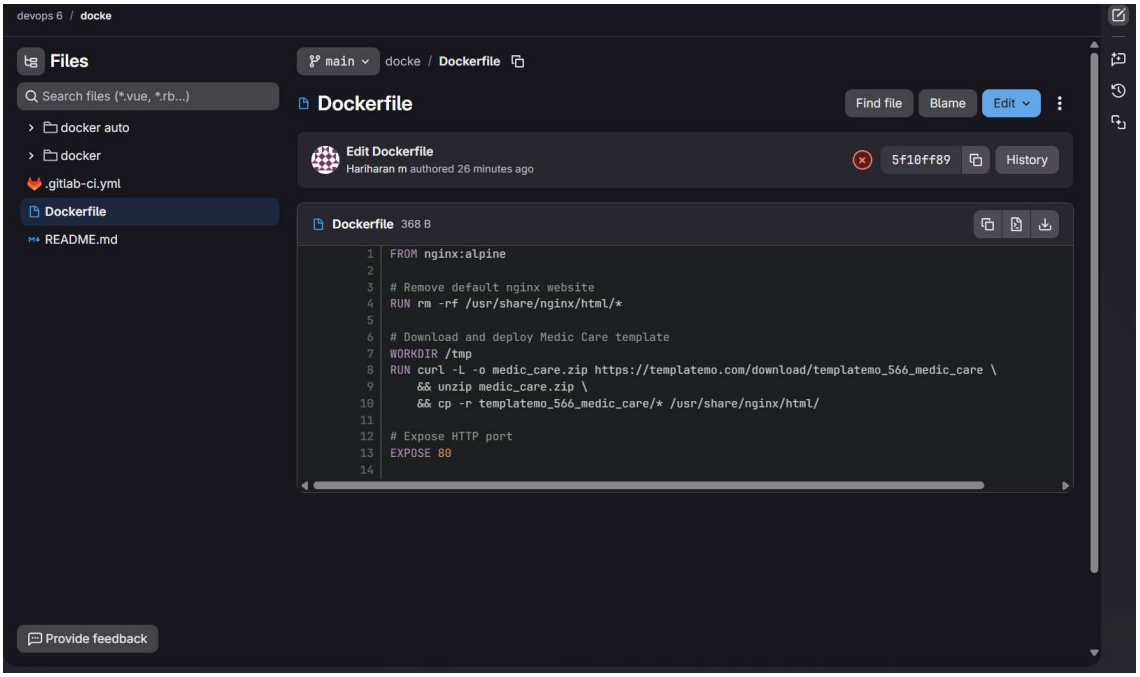
What a Dockerfile really is

A **Dockerfile** is a **blueprint**.

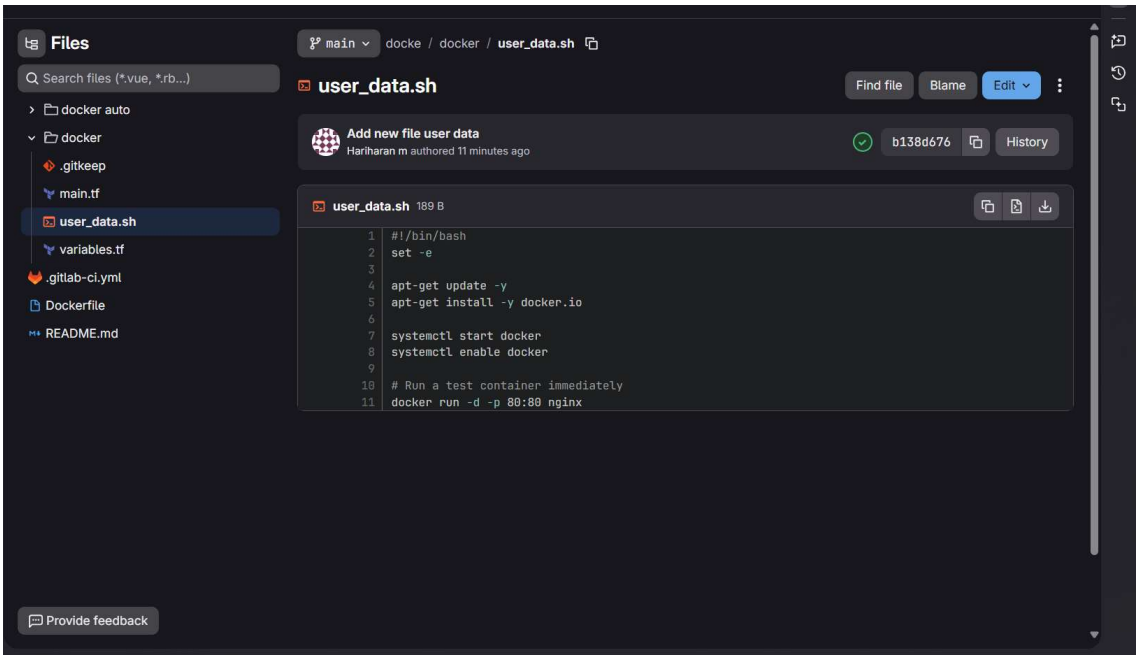
It's a **step-by-step recipe** that tells Docker **how to build an image**.

Image = frozen snapshot of an environment.
Container = running instance of that image.

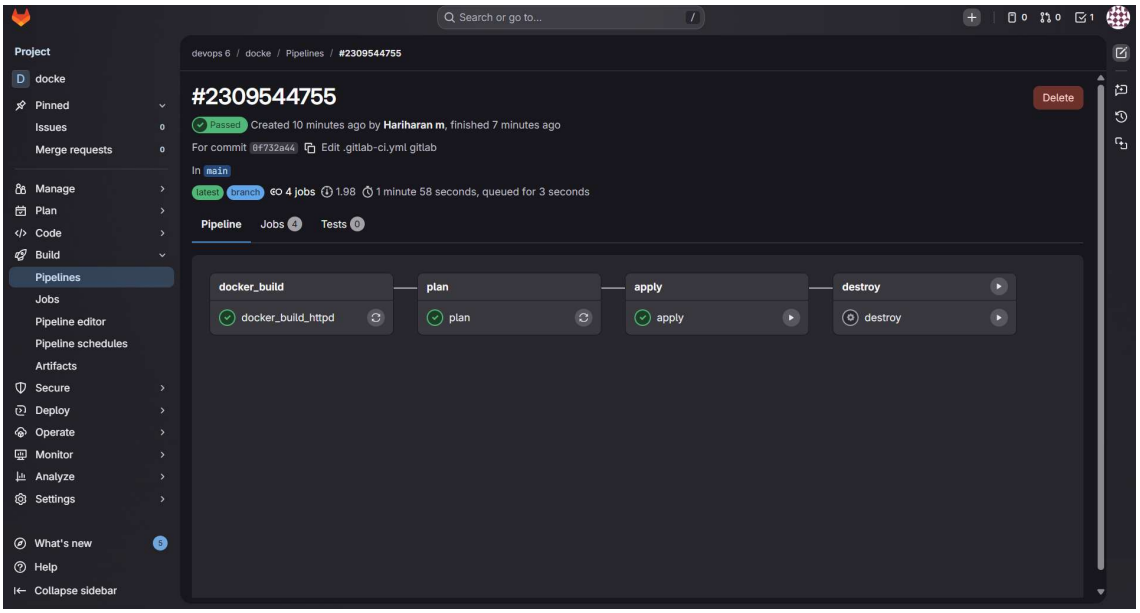
I have created the **nginx** using the **Dockerfile.**

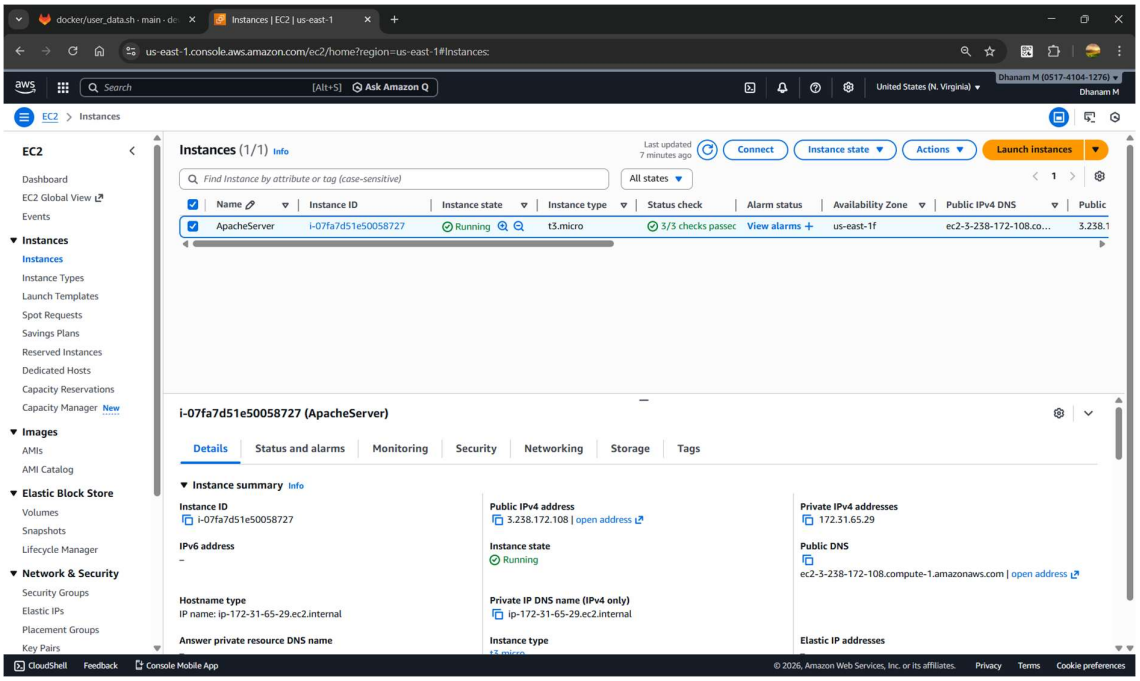


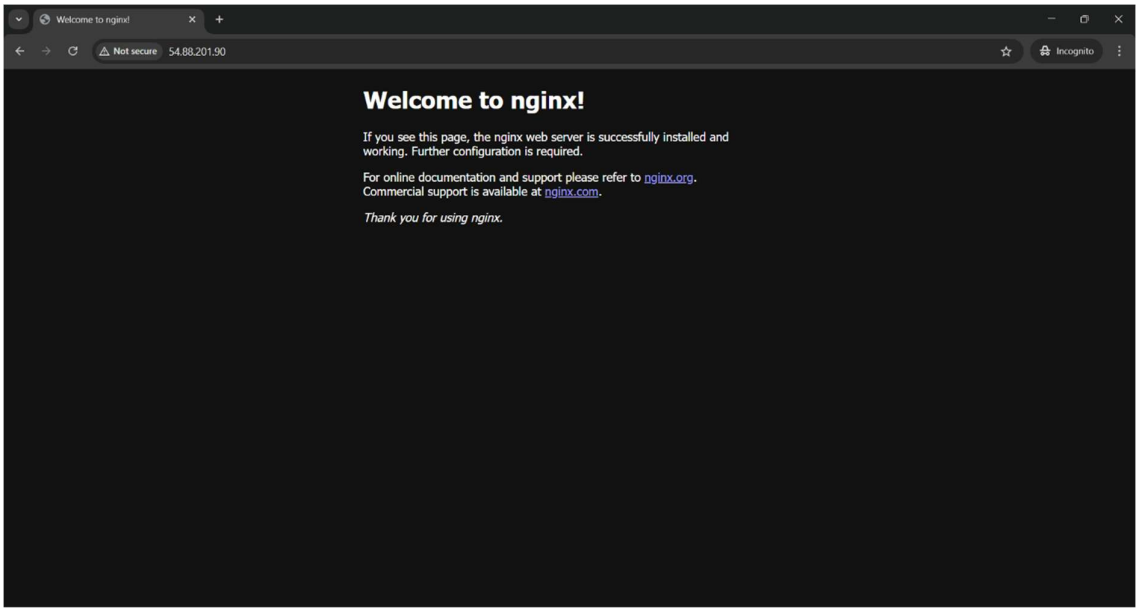
And then **user_data.sh** file.



Using this the jobs have been done.







Then the **nginx** server have been hosted.
