Integration of webhook with Jenkins

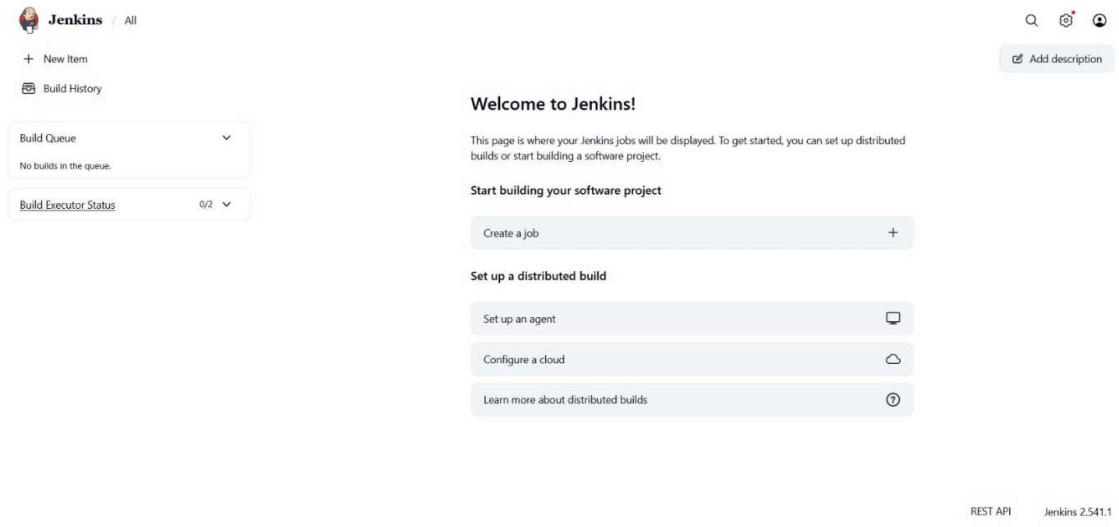
What a Webhook Actually Does

A **webhook** tells Jenkins:

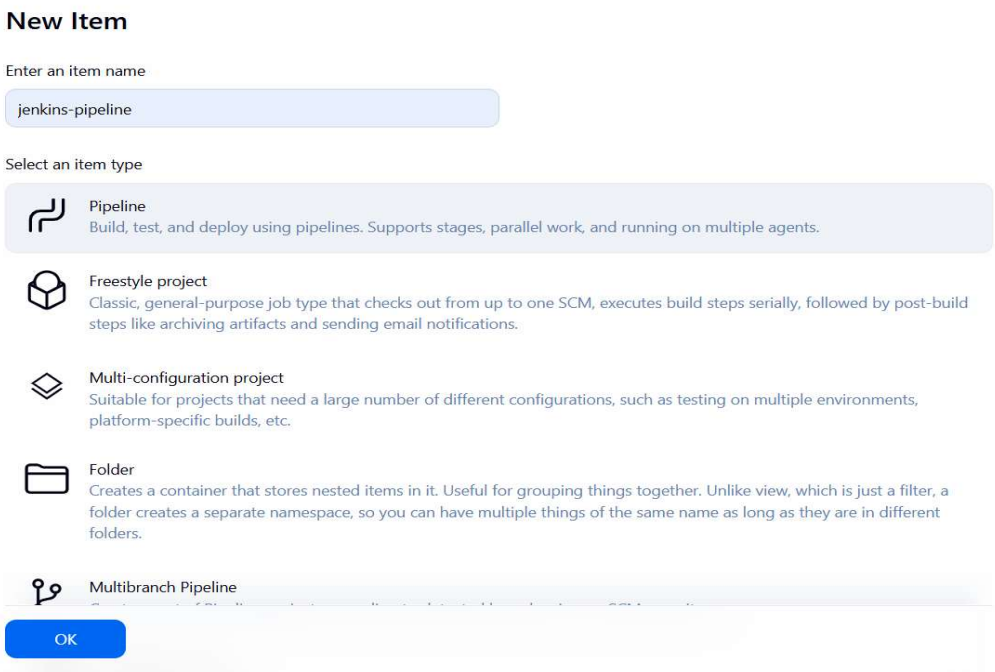
“Hey, someone pushed code. Run the pipeline NOW.”

Without webhook → Jenkins keeps polling → inefficient.
With webhook → instant trigger.

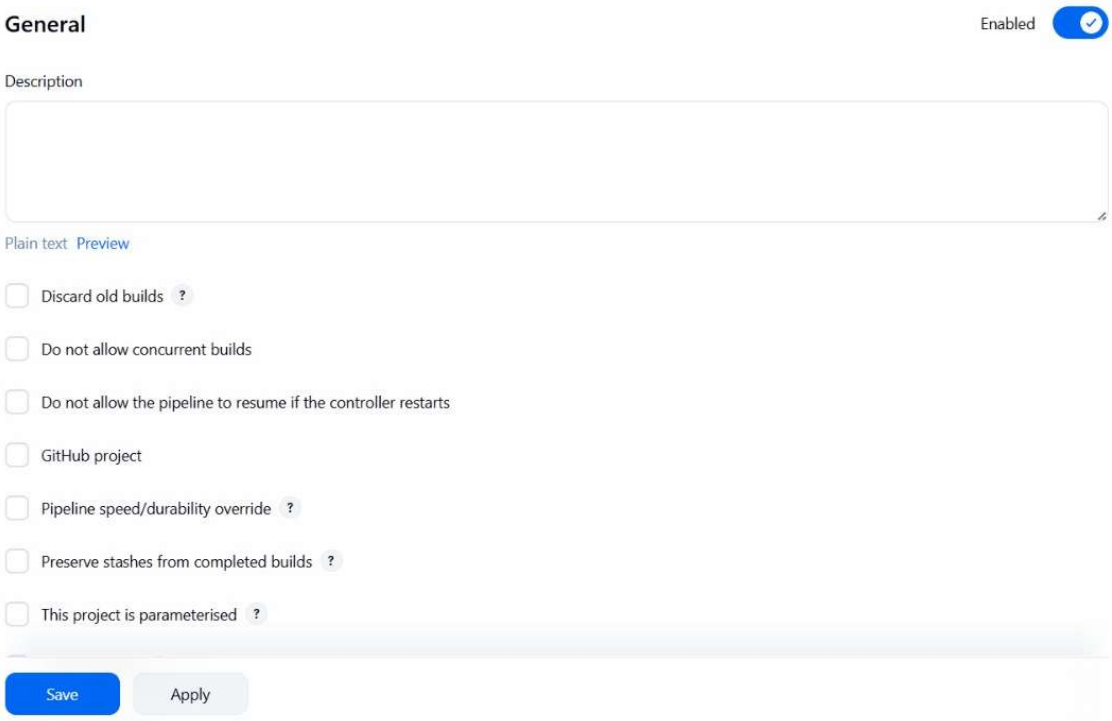
This is the normal front page of the Jenkins.



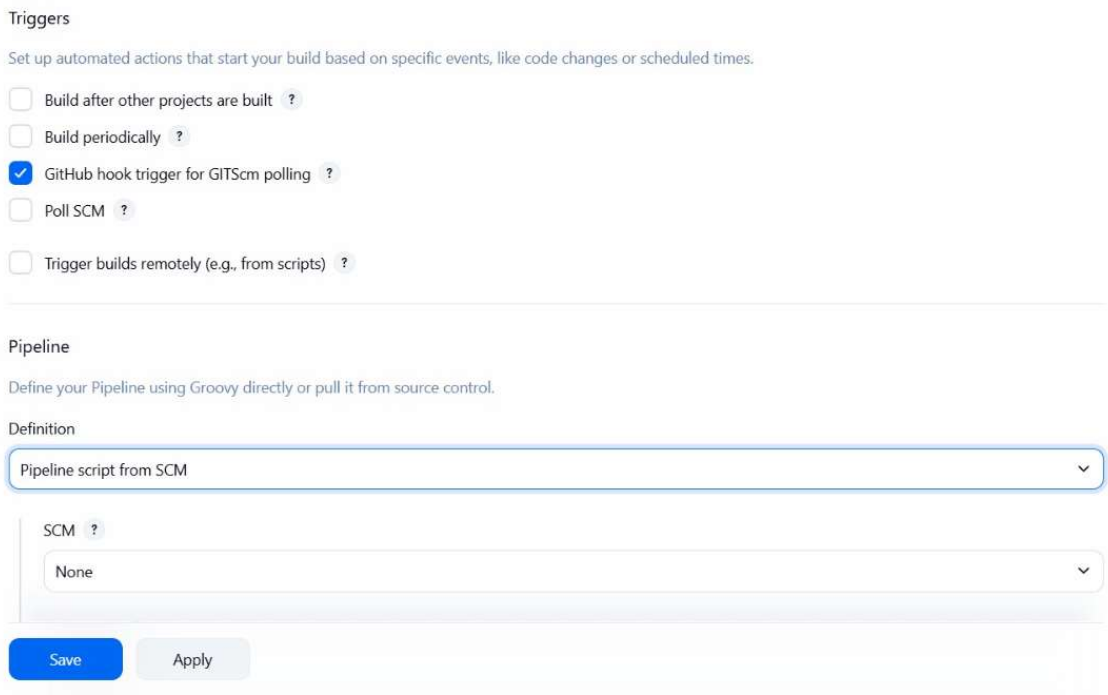
Then we have to select the pipeline to create an pipeline to start automation.



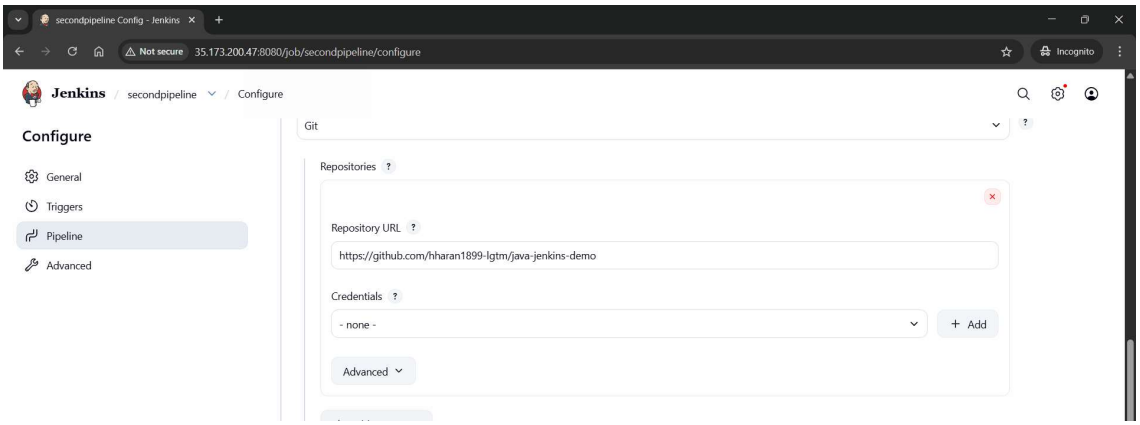
Then we have to go to triggers option.



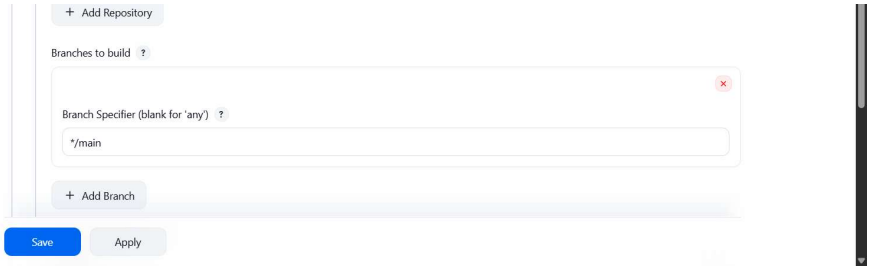
In the triggers option we have to tick the webhook checkbox and we have to give pipeline script like the from the git.



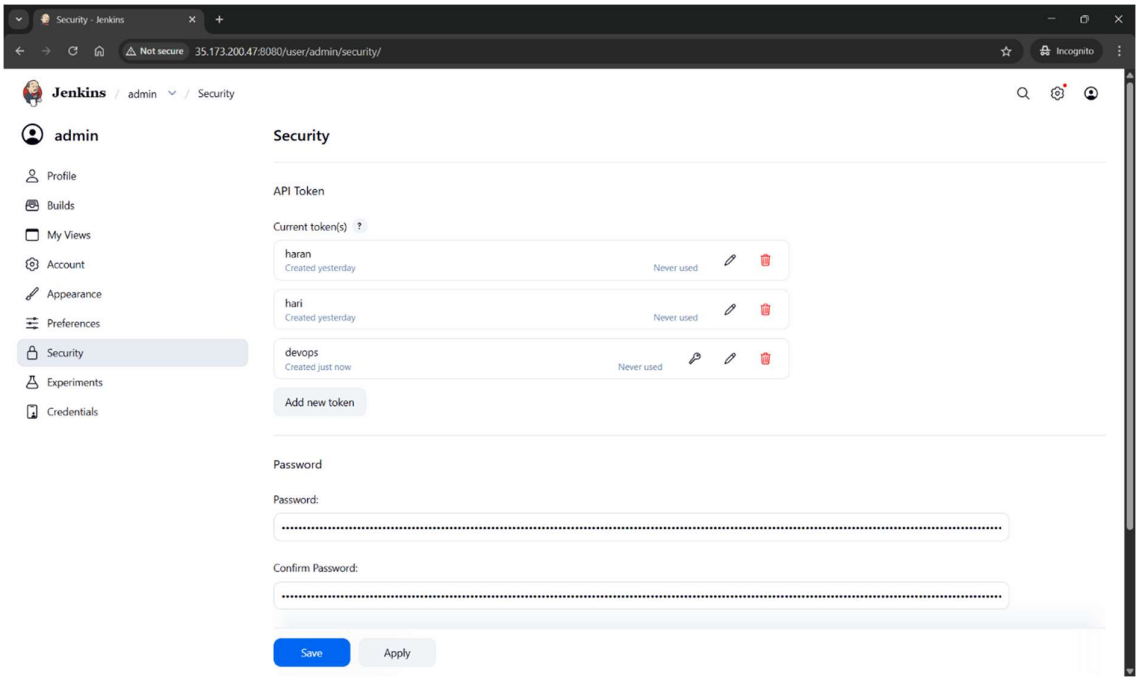
Then we have to give our github repository link in the **Repository URL** option.



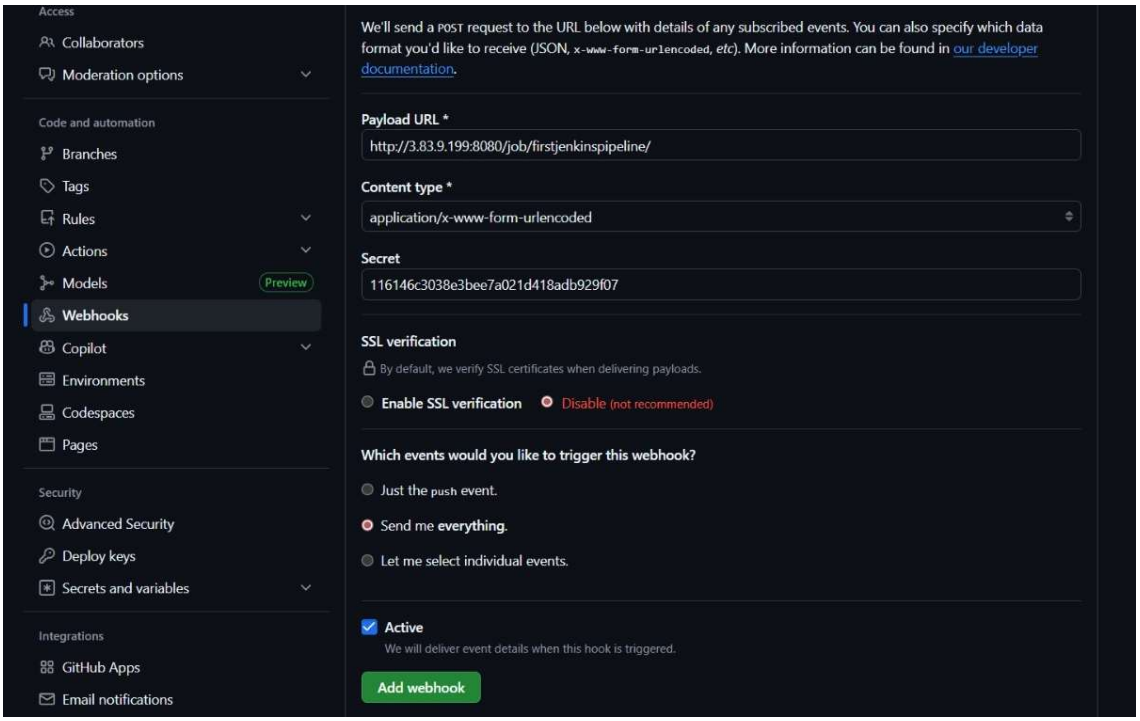
We have to mention where to build the pipeline.

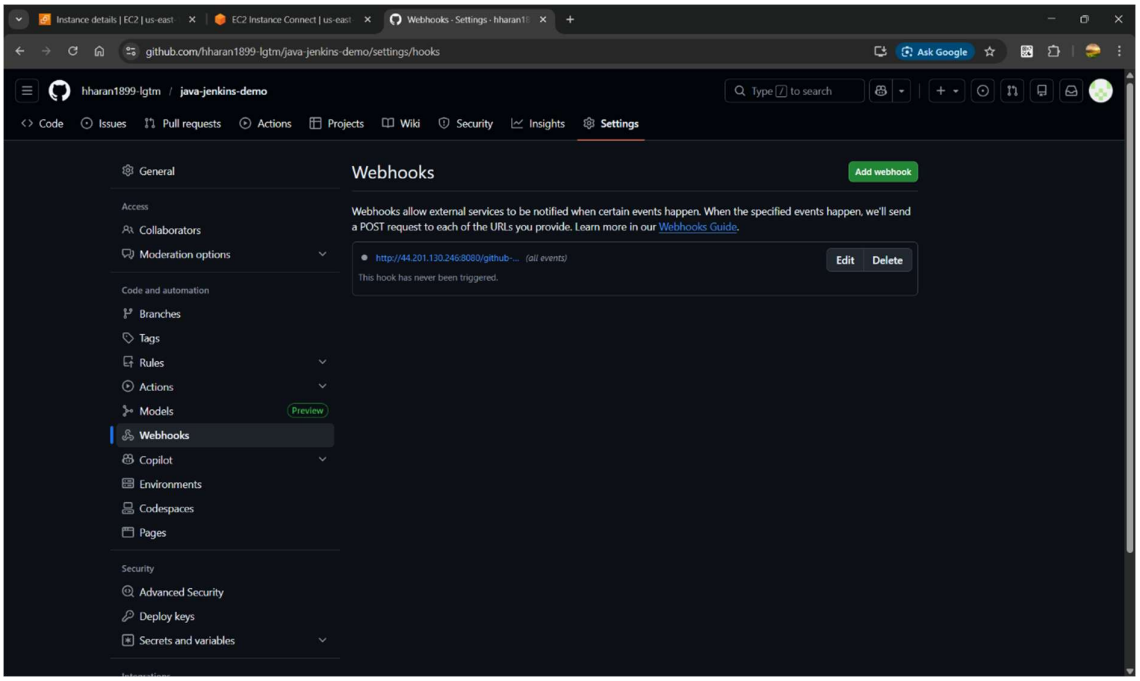


And the we have to connect through webhook so we have to create an token from the Jenkins and using the token we connect the Jenkins and github.

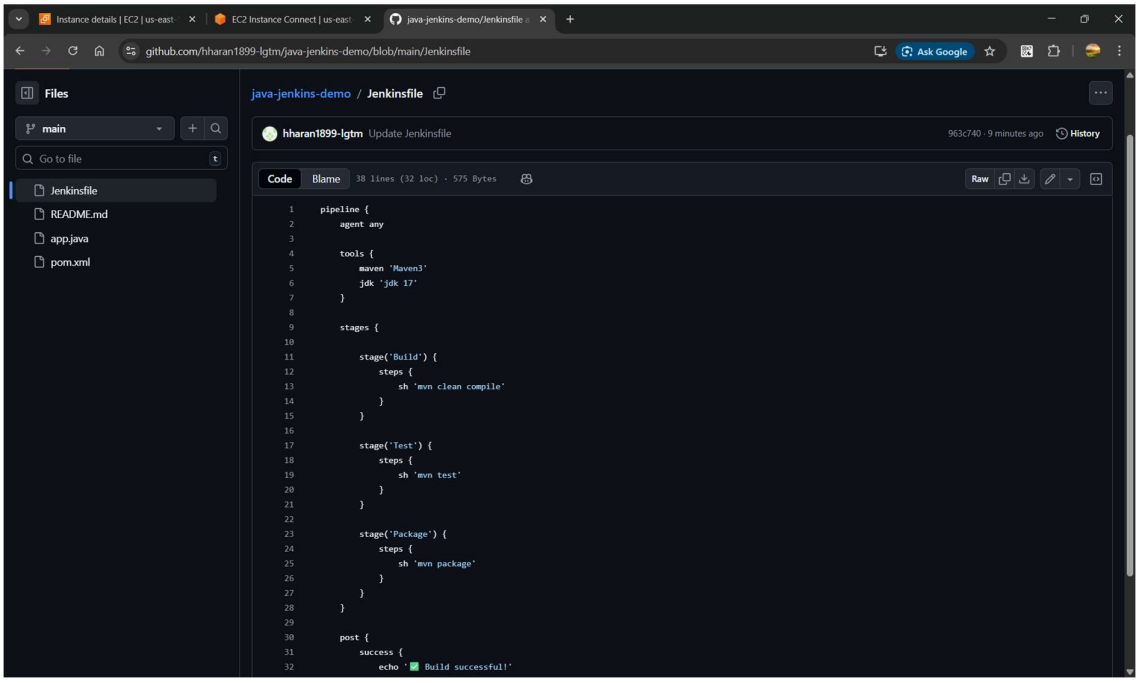


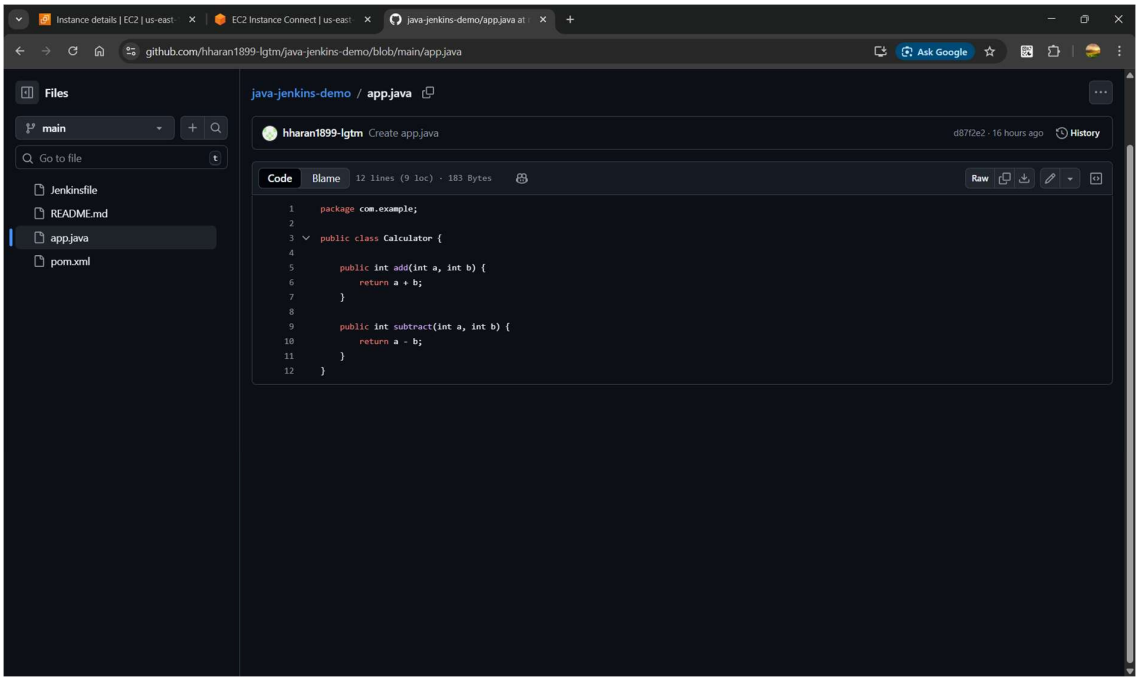
We have to connect to the github by the webhook. Available in the repo settings.

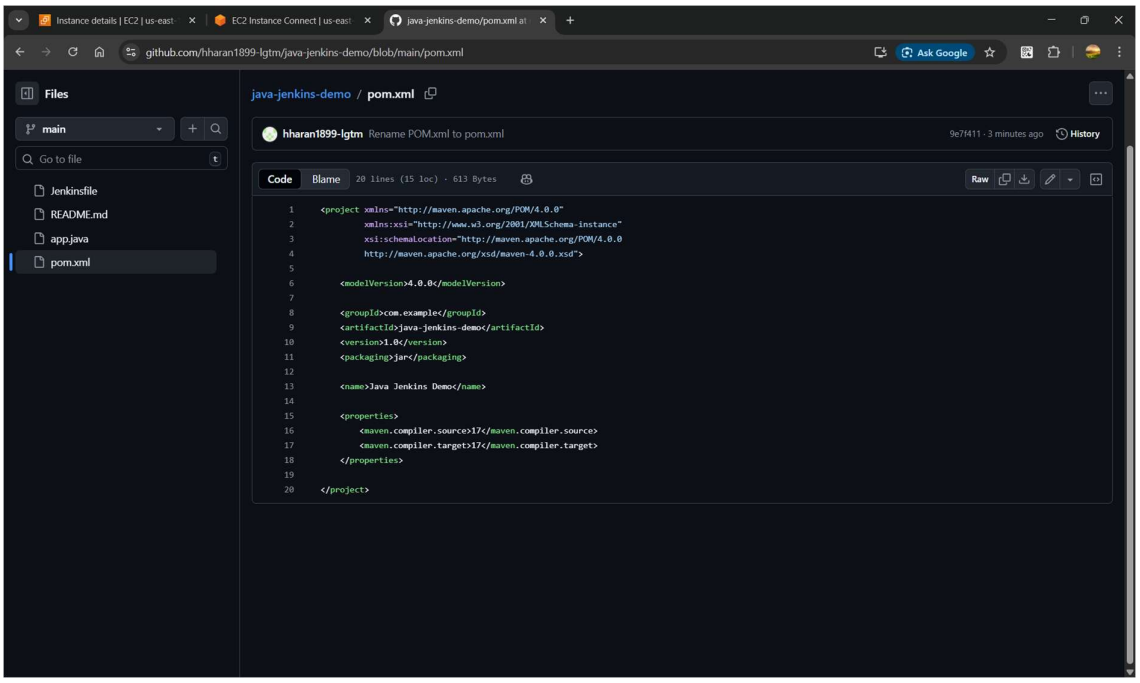




Open github create new repository “java-jenkins-demo” to create a new file “jenkinsfile” “app.java” “pom.xml”.

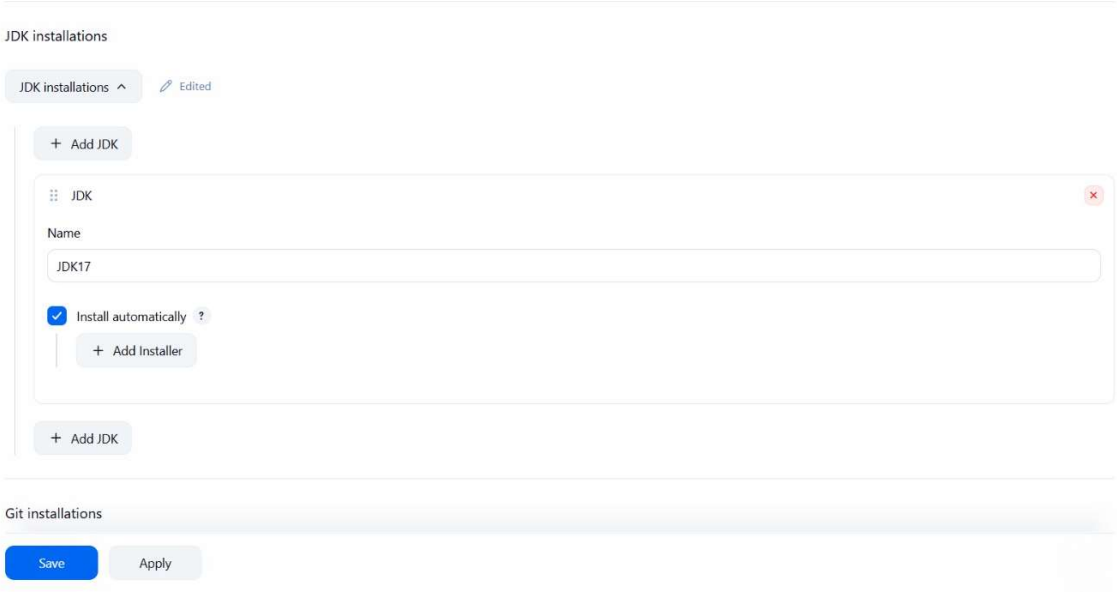




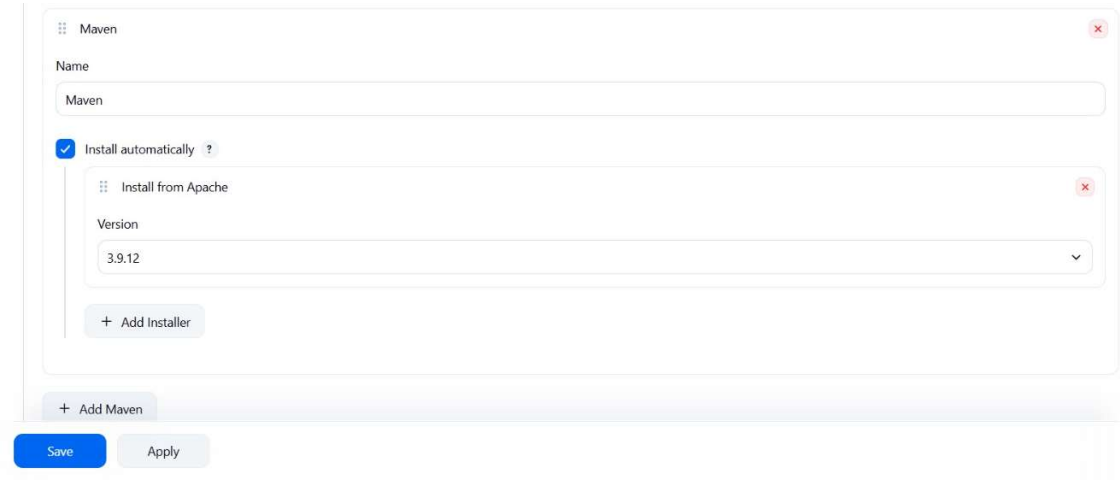


And then I have to install java and maven in the Jenkins.

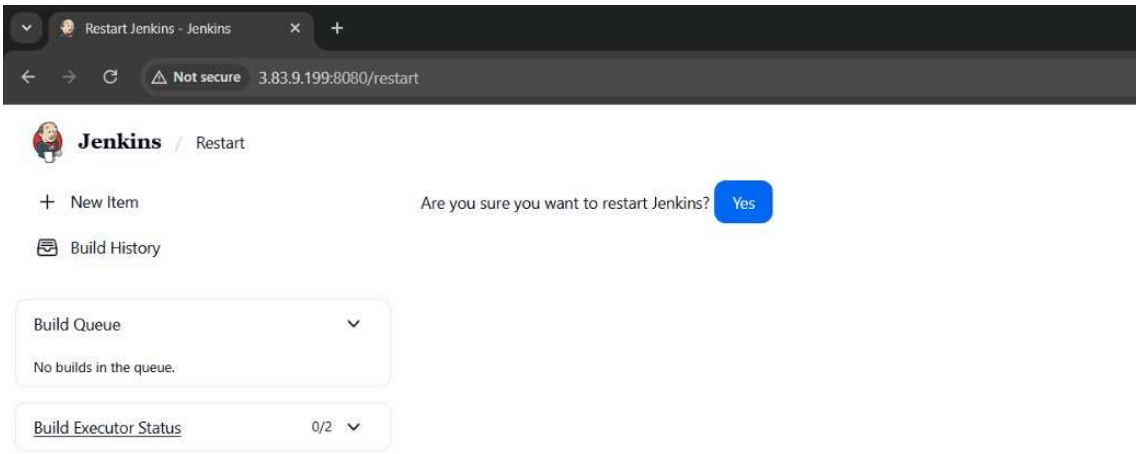
This is java **JAVA JDK17**.



This is Maven **MAVEN (or) MAVEN3**.



Once again you have to restart Jenkins if any error displayed. We have to restart by **http://<public ip>:8080/restart**. When you use this the Jenkins will ask you that are you sure to restart.



When I installed all the packages the pipeline has been executed successfully.

Console - #13 - Jenkins
