Ansible - adhoc commands and playbook

What are Ad-Hoc Commands in Ansible?

An ad-hoc command is a one-line instruction used to perform a quick task on remote machines without writing a playbook.

It is imperative automation, not structured automation.

These are the example of ad hoc commands.

```
[ec2-user@ip-172-31-89-110 ~]$ ansible all -i inventory.txt -m copy -a "src=hari dest=/tmp"

What Is a Playbook?

A playbook in Ansible is a YAML file that defines automation in a structured, repeatable way.

It describes:

- Which machines to target

- What tasks to run
- In what order
- With what privileges
- Under what conditions

```
---
- name: Install and Start Nginx
  hosts: webservers
  become: yes
  tasks:
    - name: Install nginx
      apt:
        name: nginx
        state: present
    - name: Start nginx
      service:
        name: nginx
        state: started
```

I have installed the nginx and hosted on the web.

And then I have installed the JAVA , NODE.js .

The process have been done using the playbook.

ec2-user@ip-172-31-89-110:~

```
      ignore_errors: yes

    - debug:
        var: node_output.stdout
[ec2-user@ip-172-31-89-110 ~]$ ansible-playbook -i inventory.txt playbook.yaml
